ABSTRACT

When the operation mode is manual focus control mode and setting such that auxiliary function is performed is made, a microcomputer (14) serves to set an enlarged image generation region within an image generation region, a signal processing unit (5) implements processing to an image signal of the enlarged image generation region, and a display processing unit (7) generates an image enlarged so as to take a predetermined size from an image signal processed by the signal processing unit (5) to display the enlarged image on a display unit (8). The microcomputer (14) sets the enlarged image generation region at a position moved by hand movement quantity from a predetermined position.
